# INTERNATIONAL A-LEVEL PHYSICS

## Unit 5 Physics in practice

Time allowed: 2 hours

### Materials

For this paper you must have:

- a Data and Formulae Booklet as a loose insert
- a ruler with millimetre measurements
- a scientific calculator, which you are expected to use where appropriate
- a protractor.

### Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer **all** questions.
- You must answer the questions in the spaces provided. Do not write outside the box around each question or on blank pages.
- All working must be shown.
- If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- Do all rough work in this book. Cross through any work you do not want to be marked.

### Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 80.

## Section A

Answer **all** questions in this section.

0 1

**Figure 1** shows apparatus used in an experiment to investigate the energy transfers when a ball bounces on a horizontal surface.

The diagram shows the position of the ball when it is first released, and the ball at the top of its first bounce.

The ball is released from a height  $x$ .

The height  $y$  of the ball's first bounce is recorded.

Figure 1

0 1 . 1

The ball is released five times from a height  $x$  of  $750 \text{ mm} \pm 2 \text{ mm}$ . Height  $y$  is recorded each time.

**Table 1** shows the measurements of  $y$ .

Table 1

$y / \text{mm}$	505	490	485	510	495
-----------------	-----	-----	-----	-----	-----

Calculate the mean value  $y_{\text{mean}}$  for the data in **Table 1**.

[1 mark]

$y_{\text{mean}} =$  \_\_\_\_\_ mm

**0 1 . 2** Calculate the absolute uncertainty in  $y_{\text{mean}}$ .

**[1 mark]**

absolute uncertainty in  $y_{\text{mean}} =$  \_\_\_\_\_ mm

The energy  $E$  lost by the ball during its collision with the surface is given by

$$E = mgh_d$$

where  $m$  is the mass of the ball and  $h_d = x - y_{\text{mean}}$ .

**0 1 . 3** Calculate  $h_d$  and the absolute uncertainty in  $h_d$ .

**[2 marks]**

$h_d =$  \_\_\_\_\_ mm

absolute uncertainty in  $h_d =$  \_\_\_\_\_ mm

**0 1 . 4** Calculate  $E$  for  $m = 2.5$  g.

State an appropriate unit for your answer.

**[2 marks]**

$E =$  \_\_\_\_\_

unit \_\_\_\_\_

**0 1 . 5** The absolute uncertainty in  $m = \pm 0.1$  g.  
The absolute uncertainty in the gravitational field strength is negligible.

Calculate the percentage uncertainty in  $E$ .

**[2 marks]**

percentage uncertainty in  $E =$  \_\_\_\_\_ %

ANSWER IN THE SPACES PROVIDED**

0 2

**Figure 2** shows apparatus used to investigate how the frictional force acting on a block varies with the mass  $M$  placed on the block.

**Figure 2**

The suspended mass is increased in 50 g increments.

The largest mass that fails to move the block is noted.

The smallest mass that does move the block is noted.

The value of  $m$ , the minimum suspended mass that is needed to move the block, must lie within this 50 g range.

The experiment is repeated for a range of values of  $M$ . The 50 g range within which  $m$  lies is recorded for each value of  $M$ .

**Question 2 continues on the next page**

**Turn over ►**

0 2 . 1

**Figure 3** shows data for  $m$  and  $M$ .The error bars indicate the uncertainty in the value of  $m$ .Draw **two** straight lines on **Figure 3** with the maximum and minimum gradients that are consistent with the error bars.**[1 mark]****Figure 3**

**0 2 . 2** Determine the gradients of both your lines.

**[3 marks]**

maximum gradient = \_\_\_\_\_

minimum gradient = \_\_\_\_\_

**0 2 . 3** The relationship between  $m$  and  $M$  is given by:

$$m = \mu(M + M_b)$$

where  $M_b$  is the mass of the block and  $\mu$  is a constant.  
The pulley is assumed to be frictionless.

Determine maximum and minimum possible values for  $M_b$ .

**[4 marks]**

maximum possible value of  $M_b$  = \_\_\_\_\_ g

minimum possible value of  $M_b$  = \_\_\_\_\_ g

**8**

0 3

**Figure 4** shows a transformer in a circuit with an ac power supply.

**Figure 4**

The turns ratio of the transformer is  $\frac{N_s}{N_p}$ .

The apparatus was used to investigate the relationship between the turns ratio and the output voltage  $V_s$ .

The primary current  $I_p$  and the secondary current  $I_s$  were also measured.

In one experiment, the input voltage  $V_p$  was kept constant and a primary coil with 100 turns was used.

**Table 2** shows the results from this experiment.

**Table 2**

$N_s$ / turns	$I_p$ / mA	$I_s$ / mA	$V_s$ / V
50	0.55	1.06	3.13
150	5.06	3.23	9.47
200	8.88	4.19	12.57

**0 3 . 1**Determine, using the turns ratio, a reliable estimate for  $V_p$ .**[2 marks]** $V_p =$  \_\_\_\_\_ V**0 3 . 2**

Calculate the efficiency of the transformer for a turns ratio of 2

**[2 marks]**

efficiency = \_\_\_\_\_

**Question 3 continues on the next page****Turn over ►**

It is suggested that the efficiency of a transformer varies with the input voltage  $V_p$ .

Your answer should include:

- any apparatus needed in addition to the apparatus shown in **Figure 4**
- the measurements that you would take
- details of the procedure you would follow
- details of how you would present and interpret your results.

**[5 marks]**

**END OF SECTION A**

**Section B**Answer **all** questions in this section.**0 5****Figure 6** shows the basic structure of an X-ray tube.**Figure 6**

The X-ray tube has a potential difference (pd) of 66 kV between the filament and the target.

The current in the electron beam is 140 mA.

The tube converts 98.5% of the energy input into heating the target. The remaining energy is used to emit X-rays.

The target is made from a material with a specific heat capacity of  $134 \text{ J kg}^{-1} \text{ K}^{-1}$  and has a mass of 0.28 kg.

**0 5 . 1**

Calculate the minimum wavelength of X-rays produced by the tube.

**[3 marks]**

minimum wavelength = \_\_\_\_\_ m

**Question 5 continues on the next page****Turn over ►**

0 5 . 2

Show that the power of the X-ray beam is approximately 140 W.

[2 marks]

0 5 . 3

Calculate the initial rate of increase of temperature of the target when the X-ray tube is turned on.

[2 marks]

initial rate of increase of temperature = \_\_\_\_\_ K s<sup>-1</sup>

0 5 . 4

The initial rate of increase of temperature of the target is affected by changing the magnitude of the pd between the filament and the target.

Explain, with reference to the electrons in the electron beam, the effect of **increasing** the pd.

[1 mark]

---

---

---

---

0 5 . 5

The initial rate of increase of temperature of the target is affected by changing the magnitude of the filament current.

Explain, with reference to the electrons in the electron beam, the effect of **increasing** the filament current.

[1 mark]

---

---

---

---

0 5 . 6

The filament in the X-ray tube has a temperature of approximately 2400 °C when the X-ray tube is operating.

Discuss the energy transfers that occur at the filament when the X-ray tube is operating.

0 6

This question is about the toughness of materials. A tough material is one that can absorb a lot of energy and deform before breaking. One way of measuring toughness is to determine the amount of energy per unit volume that a material can absorb before breaking.

0 6

1

**Figure 7** shows a graph of stress  $\sigma$  against strain  $\varepsilon$  for a material.  $\sigma_b$  and  $\varepsilon_b$  are the stress and the strain at the breaking point.

**Figure 7**

Show that the area under the stress–strain graph in **Figure 7** is equivalent to the energy per unit volume absorbed by the material.

**[3 marks]**

**Figure 8** shows a stress–strain curve for a metal. The breaking strain is 0.4

**Figure 8**

**0 6 . 2** Explain what is meant by a breaking strain of 0.4

**[1 mark]**

---

---

---

**0 6 . 3** Estimate the toughness of the metal.

**[2 marks]**

toughness = \_\_\_\_\_  $\text{J m}^{-3}$

**Question 6 continues on the next page**

**Turn over ►**

0 6 . 4

**Figures 9A, 9B and 9C** show a different way of comparing the toughness of materials.

**Figure 9A****Figure 9B****Figure 9C**

In **Figure 9A**, a sample of a material is placed in a clamp. A pivoted hammer is held in a stationary, horizontal position.

In **Figure 9B**, the hammer is released and swings down to hit the sample.

In **Figure 9C**, the hammer breaks the sample and swings to a new maximum height having transferred energy to the sample. In this case, the hammer swings to an angle of  $38^\circ$  to the horizontal.

The hammer head has a mass of 2.5 kg and its centre of mass is 0.45 m from the pivot.

Ignore air resistance and the mass of the hammer shaft.

Show that the speed of the hammer head as it reaches the sample is approximately  $3.0 \text{ m s}^{-1}$ .

**[2 marks]**

0 6 . 5

Calculate the energy absorbed by the sample in the collision with the hammer head.

**[3 marks]**

energy absorbed = \_\_\_\_\_ J

0 6 . 6

The hammer head experiences an impulse of 2.8 N s due to its collision with the sample.

Calculate the momentum of the hammer head immediately after the collision.

**[2 marks]**momentum = \_\_\_\_\_ kg m s<sup>-1</sup>

0 6 . 7

Compare the impulse experienced by the hammer head with the impulse experienced by the broken piece of the sample in this collision.

**[2 marks]**

0 7

A ship has a radar system to detect other ships nearby.

**Figure 10** shows a radar antenna. The antenna rotates about its axis of rotation and emits electromagnetic waves.

The radar system is switched on and the antenna accelerates uniformly from rest to its maximum angular speed. It reaches its maximum angular speed after accelerating for one quarter of a turn. It then remains at this angular speed.

The antenna behaves like a uniform rod rotating about its centre of mass. Its moment of inertia is  $0.92 \text{ kg m}^2$ .

**Figure 10**

0 7 . 1

The antenna has a maximum angular speed of  $4.2 \text{ rad s}^{-1}$ .

Calculate its period of rotation.

**[1 mark]**

period of rotation = \_\_\_\_\_ s

0 7 . 2

Show that the average angular acceleration of the antenna during its first quarter turn is approximately  $5.6 \text{ rad s}^{-2}$ .

**[3 marks]**

0 7 . 3

Calculate the torque applied to the antenna while it is accelerating.  
Resistive torques are negligible.

**[1 mark]**

torque = \_\_\_\_\_ N m

0 7 . 4

The antenna emits electromagnetic waves with an average power of 10 kW.  
The angular acceleration of the antenna takes 0.748 s.

Show that the power required to accelerate the antenna is insignificant compared with  
the power of the emitted electromagnetic waves.

**[3 marks]**

---

---

0 7 . 5

Determine, in  $\text{W m}^{-2}$ , the average intensity of the electromagnetic waves at a distance  
15 km from the antenna.

**[2 marks]**average intensity = \_\_\_\_\_  $\text{W m}^{-2}$ **Question 7 continues on the next page****Turn over ►**

The ship has two radar antennas **X** and **Y** as shown in **Figure 11**. They rotate at the same angular speed and emit electromagnetic waves of wavelength 10 cm.

The antennas behave like uniform rods rotating about their centres of mass.

**Figure 11**

**X** has a length of 1.30 m, a mass of 6.5 kg and a moment of inertia of  $0.92 \text{ kg m}^2$ .

**Y** has a length of 0.40 m and a mass of 1.9 kg.

The mass is distributed in the same way in each antenna.

**0 7 . 6** Calculate the moment of inertia of antenna **Y**.

**[3 marks]**

moment of inertia = \_\_\_\_\_  $\text{kg m}^2$

0 7 . 7

Explain why interference is possible between waves from the two antennas.

**[2 marks]**

---

---

---

---

0 7 . 8

A second ship is 15 km away from the antennas.

The two antennas are separated by a distance of 8.4 m.

Calculate the fringe separation at the position of the second ship.

**[2 marks]**

fringe separation = \_\_\_\_\_ m
